

Joint Tactical Radio System (JTRS) Wideband Network Waveform (WNW) Architecture Study

Phase I

Summary Briefing

**Johns Hopkins University Applied Physics Laboratory
(JHU/APL)**

October 2002

Purpose

Provide support to JTRS WNW IPT for architecture and requirements

◆ ***Develop object definition Information Exchange Requirements (JIER's)***

◆ ***Propose candidate set of network architectures***

◆ ***Provide representative operational scenario (vignettes)***

◆ ***Create COMTEST scenario generation files describing those vignettes***

Sponsor: JTRS JPO, WNW IPT

Background

Study Structure

♦ **Phase I:** A study effort to develop and conduct a 1st order qualitative identification of 1-3 candidate WNW network architectures and their associated primary tasks in an operational context with high level objective joint information exchange requirements and COMTEST representation

♦ **Phase II:** A follow-on study effort to develop three additional vignettes for modeling and simulation applications

Leads To: *Conduct of detailed technical assessments of candidate architectures to further quantify WNW network requirements.*

Approach

◆ **Top-down**

- **Derive requirements from MNS, ORD, FDD, and operational documentation**
- **Consider relevant studies as applicable**
- **Joint Scenario provides context**

◆ **Bottom-up**

- **Select embedded vignette and decompose**
- **Examine node information flow requirements**
- **Provide statistical analysis of network traffic**

Deliverables

◆ **Phase I:**

- ☐ **Joint Scenario # 1**
- ☐ **Joint Vignette**
- ☐ **(WNW Objective) Joint Information Exchange Requirements**
- ☐ **COMTEST files (SDF/MDF/PDEF) for joint vignette.**
- ☐ **Network Traffic Characterization**
- ☐ **1-3 candidate WNW network architectures with associated qualitative assessment**
- ☐ **Interim Report**

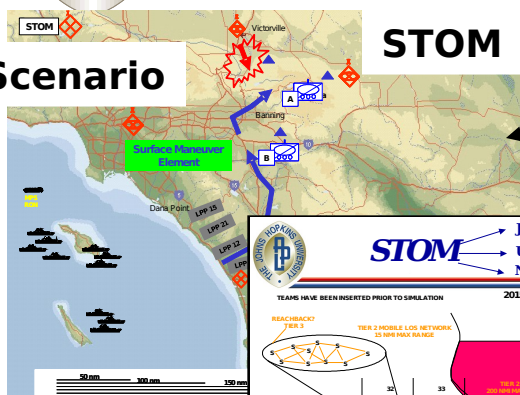

◆ **Phase II:**

- ☐ **Selected technical studies addressing system and associated interfaces for WNW network architecture candidates.**
- ☐ **COMTEST vignettes for USMC(2) and USN**

JIER's

Describes Information Flow Between Nodes

Traffic Models and Characterization

- ♦ **JIERs provide the basis for:**
 - ♦ Traffic model: used in modeling/simulation
 - ♦ Traffic characterization: analysis of loads; insights for communications design

- ♦ Loads on a physical link will be an aggregation of various message flows which is by nature stochastic
- ♦ Tabular methods do not completely describe but provide some characterization of “drivers”

FUNCTIONS	TASK	DATA VOLUME	INTERVAL	LATENCY
C2 to Sensor	Provide Recurring/Updated Mission Plan	10KB	100 hrs.	10 min.
C2 to Sensor	Frago	10KB	30 min.	1 min.
C2 to Sensor	Coordinate Operations	1KB	1 hr.	10 sec.
C2 to Sensor	Request Sensor Coverage	1KB	1 hr.	1 sec.
⋮	⋮	⋮	⋮	⋮

Functional Capacity

Instantaneous Capacity

Sensor-to-C2 and C2-to-C2 loads are the largest

Receiving Function

Sending Function

	C2	Sensor	Weapon	Logistics
C2	2443.07	127.33	415.33	91.33
Sensor	2559.73	0.00	16.40	96.40
Weapon	96.40	56.40	0.00	96.40
Logistics	48.40	48.40	48.40	0.47

Functional Capacity

Average Capacity

Network must be able to handle bursty communications traffic

Receiving Function

Sending Function

	C2	Sensor	Weapon	Logistics
C2	46.78	1.20	11.88	1.20
Sensor	413.92	0.00	0.02	40.04
Weapon	40.03	0.03	0.00	40.04
Logistics	40.00	40.00	40.00	0.08

Capacity for Coalition, Reachback, CMOC

Instantaneous Capacity

Reachback traffic is largest contributor and evenly distributed (to/from)

Capacity for Coalition, Reachback, CMOC

Average Capacity

Coalition, Reachback and CMOC traffic is bursty

Worst-Case Loads Between Nodes

No architecture or routing implied.
End-to-end source to destination capacity requirements only.

0-10 Kbps
10-100 Kbps
100-1000 Kbps
1000+ Kbps

This slide *illustrates* the complexity of the information exchange in a typical Joint

Node Capacities

- ◆ **Grouping send/receive messages together results in large capacities for particular nodes**
 - **Multiple JTRS WNW radios potentially needed**
 - ***Note this is worst case, statistical multiplexing of traffic will lessen burden***

Possible Architecture Hierarchies

Architectural Topologies

Architectural Technologies

MEU

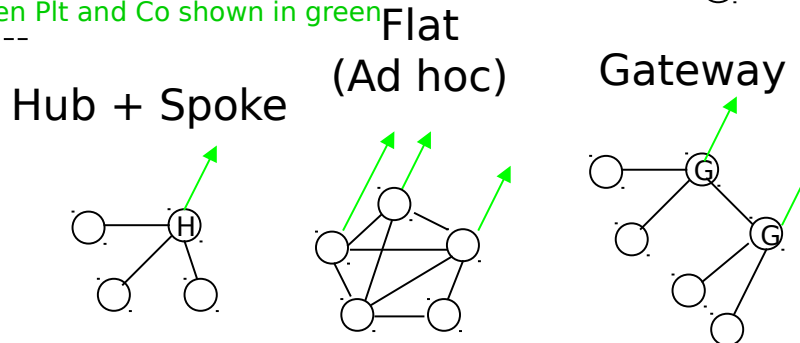

glue - connection between Bn and Co shown in brown

BN
(Inter- Plts)

glue - connection between Plt and Co shown in green

CO
(Inter- Node)

♦ **Communications technologies will be overlayed onto the topologies**

♦ **Assessed general pros/cons of architectures in Phase I**

♦ **Platforms will be addressed as part of technologies to determine appropriate roles**

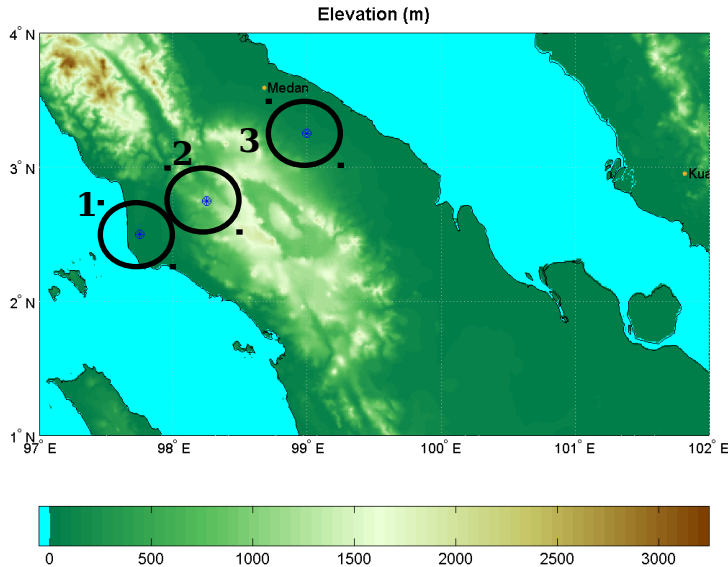

□ **UAVs**

□ **SATCOM**

□ **other**

Typical Trade Study (Connectivity)

- ♦ **LOS connectivity only reliably achieved over very small distances**
- ♦ **A low flying UAV provides highly reliable LOS connectivity**

- ♦ **Three regions, similar to encountered in phases of OMFTS**
- ♦ **Ranges considered for:**
 - Subregion size
 - Antenna height
 - UAV height
- ♦ **Monte Carlo analysis**

Summary

- ♦ Study products are process and :
 - OD04 Scenario Vignette
 - JIER Set
 - COMTEST Files
 - Traffic Model results
 - Architecture recommendations
- ♦ Methodology responsive to excursion
- ♦ Scenario and Vignette represents an operational joint force structure view
- ♦ Joint Information Exchange Requirements developed to provide mechanism for quantitative, broad based architectural analysis
- ♦ Traffic Characterization indicates specific trends for data flow rates across 2018 architecture
- ♦ Candidate Architectures are qualitative but provide scoping tool for continued refinement of WNW requirements and mission needs evaluation
